First Steps with FastAPI

Reindert-Jan Ekker

@rjekker www.codesensei.nl

Overview

Create a FastAPI app

- Explore
- Run

Check result in browser

- REST Api
- Auto-generated documentation

Common Problems

FastAPI code execution

- Async

Demo

- Start a PyCharm project
- Install FastAPI
- Create a FastAPI app
- Run
- Inspect the result

Control flow is dictated by incoming HTTP Requests

An operation is only called if its URL is requested.

```
python -m pip install "fastapi[all]”
```

Install FastAPI

Extra dependencies are installed using [all]
This includes the uvicorn server
Make sure to install in an active virtual environment

```python
from fastapi import FastAPI

app = FastAPI()
```

Creating a FastAPI Application Object

The app object represents our REST service

```python
@app.get("/date")
def date():
    """Return the current date/time."""
    return {'date': datetime.now()}
```

Add an Operation

URLs should start with a slash
There is no connection between URL and function name
When a GET request comes in for /date, the function will be called

```python
from fastapi import FastAPI

app = FastAPI()
```

Creating a FastAPI Application Object

The app object represents our REST service

```python
@app.get("/date")
def date():
    """Return the current date/time."""
    return {'date': datetime.now()}
```

Add an Operation

URLs should start with a slash
There is no connection between URL and function name
When a GET request comes in for /date, the function will be called

```
fastapi dev my_project.py
```

Running FastAPI Project

my_project.py is the name of the python file containing the application object
dev means to run in development mode: auto-reload changes in the code
In production you should use “run” instead of “dev”

Resources

FastAPI documentation: https://fastapi.tiangolo.com/

Demo code: github.com/codesensei-courses/fastapi_foundations

Summary

- Install FastAPI
- Create and run a FastAPI app
- Autogenerated documentation
- Common Problems
- FastAPI code execution
